Low Back Pain: On The CUT-LESS Edge

New technologies for bulging discs, herniated discs and low back pain are just a few of the exciting treatments **John Brendel, MD** offers his patients for the care of their spine pain.

Not all patients require open or major surgery for disc herniation pain. Certain patients may benefit from minimally invasive treatments such as Percutaneous Discectomy and Disc Repair Procedures.

These treatments are for certain types of disc pain-low back pain. Typical symptoms may range from back pain with just simply sitting, to back and leg pain when you lift or work.

The procedure involves precisely placing a very small catheter under live x-ray guidance into your injured disc and then using radiowaves at a very high frequency to repair your disc wall and help preserve and heal the disc. This is all accomplished with minimal pain and light sedation. Most patients are back at work in less than a week.

Just another example of cutting edge, or in this case cut-less edge technology, available at **Interventional Pain Specialists of Wisconsin, John Brendel, MD.**

Call **715-234-7246(PAIN)** for evaluation, or talk with your physician for a referral. We look forward to helping you get back to the life you deserve.
